Multi-View ®

Video Debriefing Software

The Ultimate Tool For
Synchronized Playback & Analysis Of
Digital Video Recordings

• **Law Enforcement** • **Fire Departments**
• **Security & Surveillance** • **Criminal Justice**
• **Military** • **Aerospace** • **Geophysical**
• **Multimedia & Video Post-production**
• **Sports** • **Bio-Medical** • **Process Control**

Feature-rich & Easy-to-use!

- **Simultaneously playback up to 24 video files using multiple digital formats**
- **Mark events & log descriptions for any video frame**
- **Re-size, zoom & crop windows—re-position anywhere**
- **Automatically synchronize videos to each other for in-depth analysis**
- **Save, load, & print still images of any video frame**

Multi-View® 2.0
Video Debriefing Software

Ideal for Military, Aerospace, Sports, Medical, Legal, Law Enforcement, Geophysical, Process Control, Multi-media, & Video Post-production applications
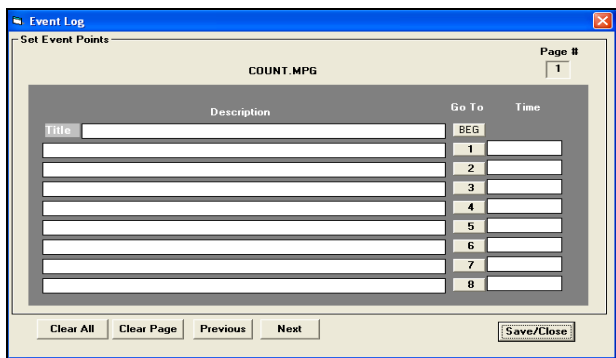

Display Up to 24 Video Windows

Multi-View can simultaneously display multiple video windows - even in different formats, within the project workspace. Each video window can be positioned, re-sized, zoomed, and cropped independently.

Synchronize Videos Together

With a simple mouse click, Multi-View creates a "match point" which defines a common point in time for each video. Changing the frame position of any video will immediately re-synchronize all of the other videos.

Mark & Log Event Points

Any video frame position can be marked with either a numeric marker or a text description associated with an event to be remembered. Access to each video's event points can be viewed in the Event Log window and "go to" directly.

Event Log Screen

Up to 72 event points may be recorded for each window. Event descriptions may be also recorded with a picture snapshot. The on-screen display will show the description of the event point when it occurs during playback or when the "seek next" or "seek previous" command is given.

Save & Print Picture Snapshots

A snapshot of any single frame from any window being displayed in the project workspace may be saved in a picture file or printed out for reference. Picture files may also be loaded into the project workspace.

Set Playback Speed & Play Loops

When slow motion analysis is required, Multi-View provides a control to change the playback speed of all windows from 0.1 x to 1 x playback speed. Multi-View also has the ability to set loop durations around a key or trigger point, playback video in full screen, plus many other useful capabilities.

Optional Precise Video Playback Tactile Jog/Shuttle

FutureVideo's MC-20PRO Multi-function Jog/Shuttle Control Surface (included with Debrief System FVS020) provides precise frame-by-frame review and optimal system control for Multi-View 2.0 users. In addition, on-screen playback control buttons are provided that can be accessed with a mouse, or by keyboard short-cut keys. The controls provide for rewinding, fast forwarding to the beginning/ending of a video clip, play/pause, seeking to trim points and event marks, stepping forward/reverse frame by frame, and loop playback.

Optional VTR Controller Available

FutureVideo's MC-100 Transport Device Controllers can be easily integrated to provide direct serial control of up to 16 VCRs or camcorders, irrespective of tape format.
